

PVC FLOORING INSTALLATION

INSTALLATION SYSTEM

A complete flooring installation system (from bottom to top) includes subfloor, primer, self-leveling, adhesive, flooring and wax. Each layer has different function, it should operate according to a complete scheme.

Subfloor

Subfloor should be inspected and fixed before starting installation.

Primer

Primer is used to lose the pore and crack on subfloor, reduce the absorptive character, at the same time, it can increase the adhesive ability between subfloor and adhesive.

Self-leveling

Self-leveling is used to make the subfloor flat and improve its strength

Adhesive

sticking vinyl flooring onto self-leveling layer

Flooring

High quality flooring can save a lot of time during installation and maintenance.

Wax

Wax not only close the flooring surface, avoid it from scratch and dust, but also make the maintenance easily.
